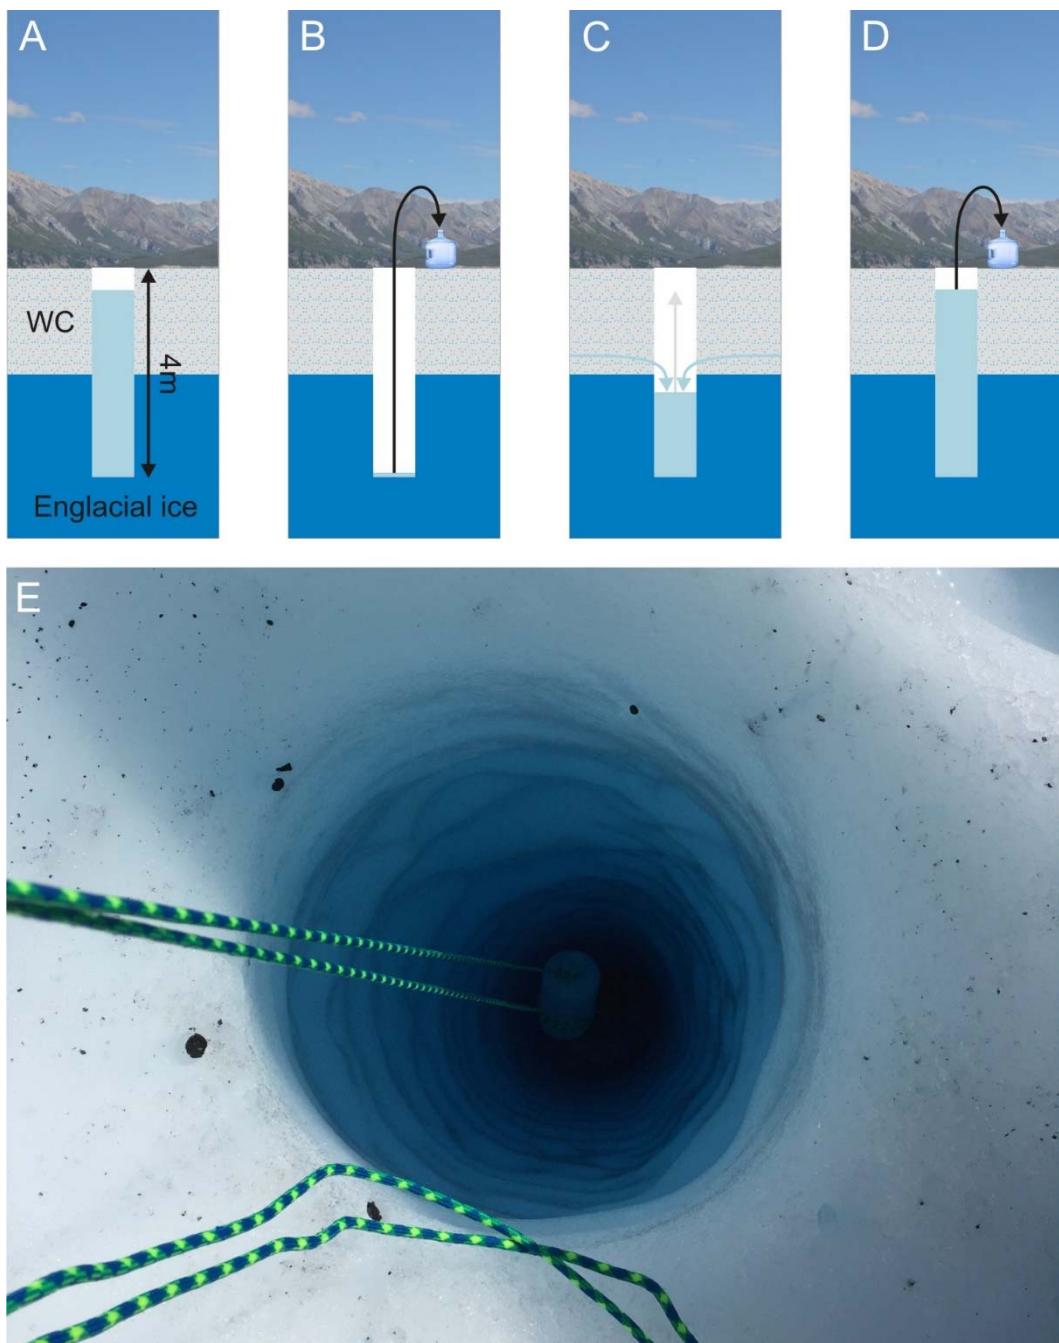

Figure S1. Sampling approach for collection of water samples from the WCA. After melting boreholes of ~4 m depth into the ice (A), the water generated was removed and sampled (B). Water that subsequently percolated laterally from the WCA collected in the boreholes (C) and was sampled at the surface with tubing and a peristaltic pump (D) or by lowering clean acid-washed HDPE bottles into the borehole (E). WC = weathering crust.

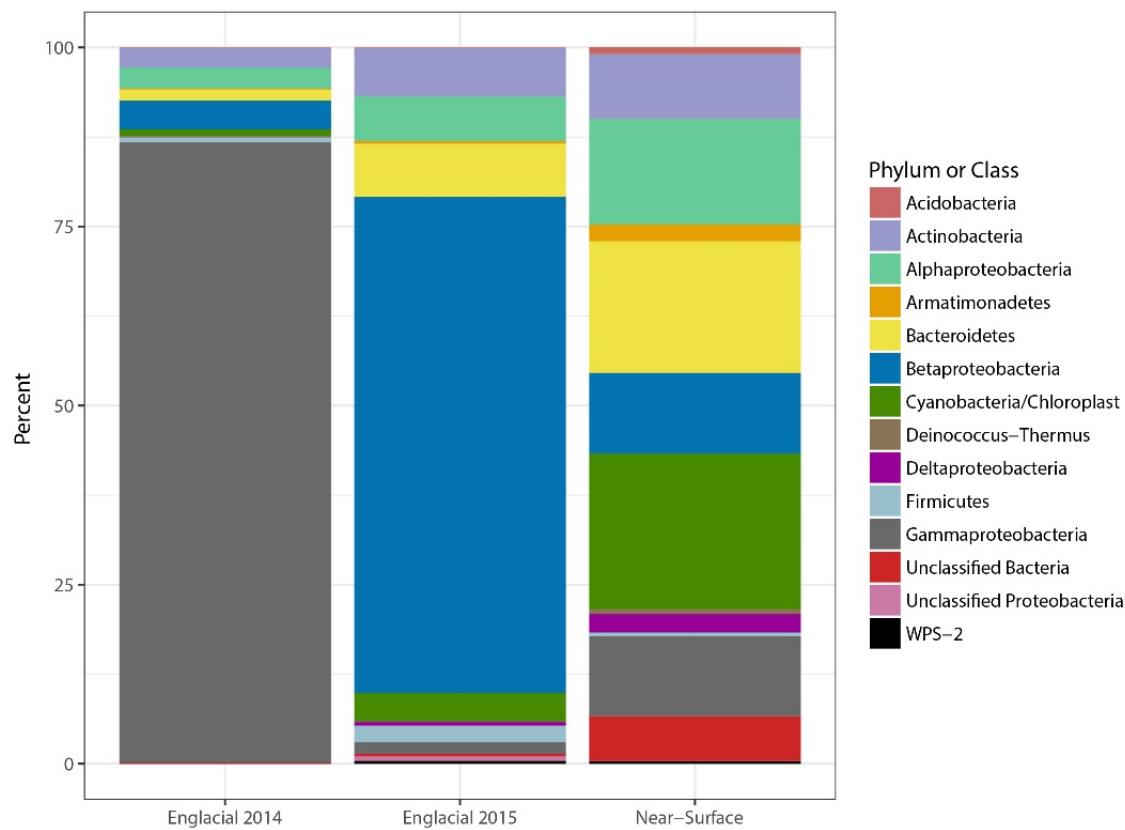

Figure S2. The relative abundance of bacterial phyla within samples obtained from the deepest boreholes ('Englacial 2014' and 'Englacial 2015') with those in near-surface ice and water. All sequences are classified at the phylum level with the exception of the Proteobacteria, which are designated by class.

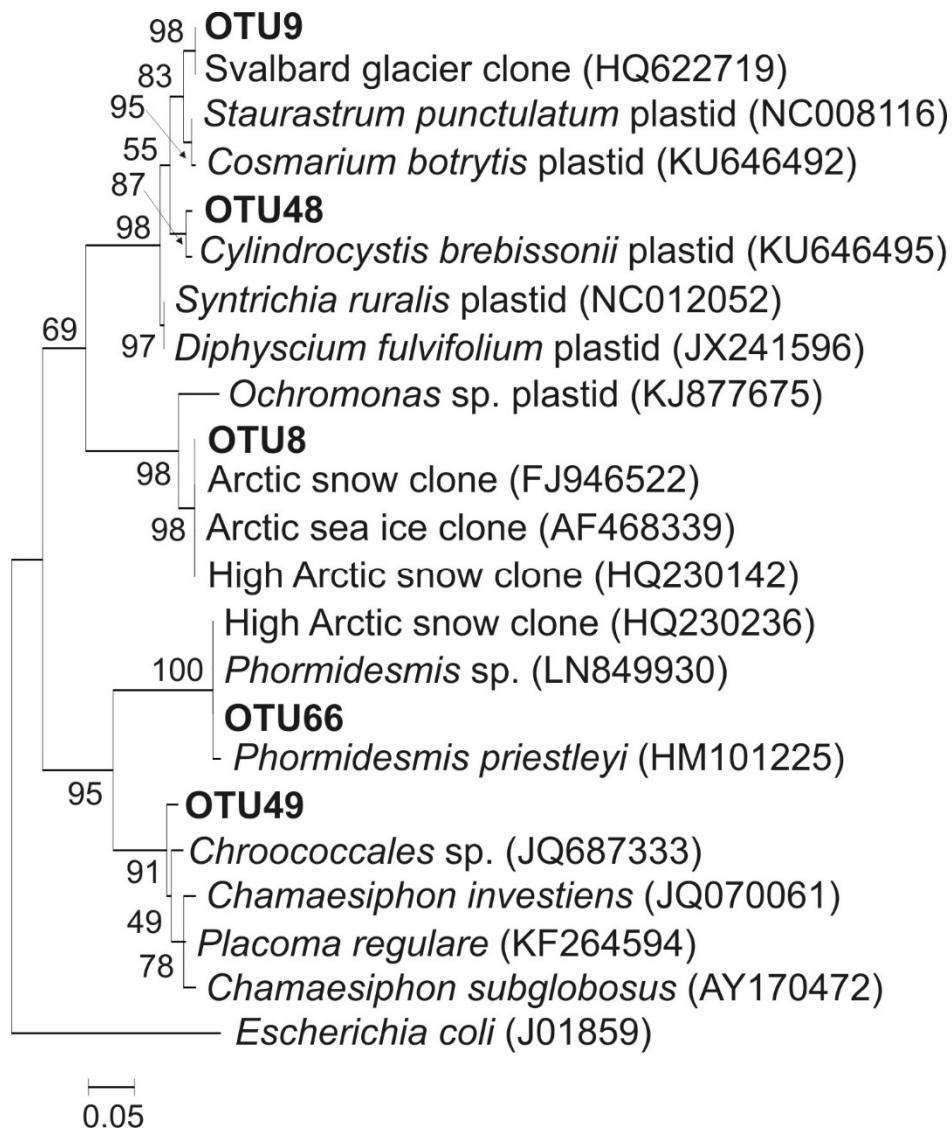

Figure S3. Phylogenetic analysis of 16S rRNA gene sequences (positions 533 to 786, *Escherichia coli* numbering) related to phototrophic cyanobacteria and algal plastids. Genbank accession numbers are listed in parentheses. The scale bar represents 0.05 substitutions per site and bootstrap values are shown as a percentage of 1000 replications.

Table S1. Year, volume, and borehole properties for the samples collected in this study.

| Sample [†] | Internal designation | Year of sampling | Sample volume (L) | Borehole | Diameter (cm) | Depth (m) |
|---------------------|----------------------|------------------|-------------------|----------|---------------|-------------|
| BH1a (0.8µm) | En1_8µm | 2014 | 10 | 1 | 30 | 10 |
| BH1a (3µm) | En1_3µm | 2014 | 10 | 1 | 30 | 10 |
| BH1b | En2 | 2014 | 50 | 1 | 30 | 10 |

[†] Ten boreholes, designated BH1 to BH10, were sampled. Multiple samples obtained from the same borehole are indicated by letters (e.g., BH1a, BH1b, and BH1c). Names followed by parentheses (e.g., 0.2µm) specify filter pore sizes for samples that were size-fractionated.

ND = no data available

Table S2. Concentration of major ions and elements (ppb) in melt water from discrete ice depths (BH6 and BH7) and the WCA (sample BH10b). The limit of detection is listed parenthetically below each analyte.

| Depth (m) or sample | Na ⁺ (0.40) | Mg ²⁺ (0.26) | Al ³⁺ (0.69) | K ⁺ (0.95) | Ca ²⁺ (0.31) | Cr ³⁺ (0.24) | Mn _(aq) (0.21) | Fe _(aq) (0.19) | Co ²⁺ (0.06) | Ni ²⁺ (0.37) | Zn ²⁺ (2.92) | Sr ²⁺ (0.25) | Ba ²⁺ (0.37) | Pb ²⁺ (0.33) | F ⁻ (112) | Cl ⁻ (90) | SO ₄ ²⁻ (41) | Br ⁻ (520) | NO ₃ ⁻ (53) | HCO ₃ ⁻ † | |

BD = below the analytical limit of detection; NA = not analyzed

† HCO₃⁻ was not analytically determined and the concentration was estimated based on charge balance.

*The WCA sample (BH10b) was pre-concentrated by a factor of 100 before analysis. The limit of detection for Na⁺ (1.0), Mg²⁺ (1.0), Al³⁺ (0.017), K⁺ (0.2), Ca²⁺ (0.7), Cr³⁺ (0.009), Mn_(aq) (0.007), Fe_(aq) (1.3), Co²⁺ (0.007), Ni²⁺ (0.004), Zn²⁺ (0.006), Ba²⁺ (0.002), Pb²⁺ (0.001), F⁻ (0.11), Cl⁻ (0.09), SO₄²⁻ (0.04), Br⁻ (0.5), and NO₃⁻ (0.05) in the WCA sample corrects for the pre-concentration factor.

Table S3. Number of sequences, coverage, and alpha diversity in the samples.

| Sample | Number of sequences | Total OTUs† | Good's coverage estimator | Inverse Simpson index |
|--------------|---------------------|-------------|---------------------------|-----------------------|
