The manuscript "Recent mass balance of Purogangri ice cap, central Tibetan Plateau, by means of differential X-band SAR interferometry" by Neckel et al. provides a mass balance estimate for the named ice cap using a combination of very interesting approaches (DInSAR and DEM differencing) based on the new TanDEM-X data. I generally support publication in "The Cryosphere", but the article needs a significant overhaul. Especially the methodological section left me with many unanswered questions.

Please see me detailed sticky notes directly in the attached manuscript.
