

## Re-Review of tc-2014-88

This is a short re-review of the Cryosphere Discussions resubmitted manuscript tc-2015-197 *Direct visualization of solute locations in laboratory ice samples* by Theodore Hullar and Cort Anastasio.

The authors have properly addressed two major issues mentioned in my review. First, the authors have considerably improved the referencing to the published background on ice observations and solute redistribution during freezing and discussed their results within this background. Second, they have properly discussed the limitations of the present study and pointed out the need of more observations and systematic studies of frozen solutions by X-ray computed tomography. I like to congratulate the authors to their work and article that I regard as suitable for publication in The Cryosphere in the present form.
