

1 Supplementary Figures and Tables

2

3 Figure S1: Ensemble of stereo matching scores per a) individual glacier and debris-covered
4 area and of b) overall glacier / debris-covered area and off-glacier terrain. On each box, the
5 central mark is the median of all DEMs (except Hexagon 1974 and WorldView 2015 DEMs
6 for which matching scores are not available). The edges of each box are the 25th and 75th
7 percentiles. The whiskers extend to the most extreme data points. The threshold slopes (s) of
8 considered areas in b) correspond to the 95th percentile of glacier slopes (45°) and the 95th
9 percentile of debris-covered glacier slopes (18°), respectively. sc is the monsoon snow-cover
10 frequency.

Figure S3: Ensemble of outlier correction uncertainties per individual glaciers and debris-covered area (a) and ensemble of outlier correction uncertainties per $\Delta h/\Delta t$ map (b). On each box, the central mark is the median of all $\Delta h/\Delta t$ maps (a) or of all glaciers / debris-covered areas (b), respectively. The edges of the box are the 25th and 75th percentiles. The dashed red lines represent the threshold set for outlier elimination (0.61 m/a). Outliers are labelled in (a) by the corresponding map IDs. Map IDs are constituted of the corresponding DEM IDs (Table 4).

- 1 Table S1: Overview of $\Delta h/\Delta t$ map outliers, ST: stable terrain uncertainty (Figure 4), U: DEM adjustment uncertainty (Figure S2), O: outlier
 2 correction uncertainty (Figure S3), D: data availability (Figure 5b, in brackets: data availability >50% but the glacier is not entirely represented
 3 on the scene). Map IDs are constituted of the corresponding DEM IDs (Table 4).
