In response to the authors' query to the Editor, I agree with reviewer 2's point about Table 1 and do not think it very helpful to set a value to zero to indicate it is not used. Overall I find this Table rather confusing with "standard value" entered in the "method of estimation column" followed by either a blank or a number in the "value" column. My suggestion is to only include columns 1 and 2, with the few cases of additional information from the "value" column included in the "comment" column (which I would rename "Description"). You can also add information like "Derived from GIS" in the description of the model parameters.
