ΔV is ice volume change after extrapolation (using regional glacier profile means to fill missing data), ΔV_d is ice volume change without extrapolation (volume change measured directly from the elevation change maps only), \bar{h} is the spatially-averaged elevation change of the glacier (after extrapolation), and \dot{b} is the geodetic mass balance for each glacier over the 32-year timespan (after extrapolation).

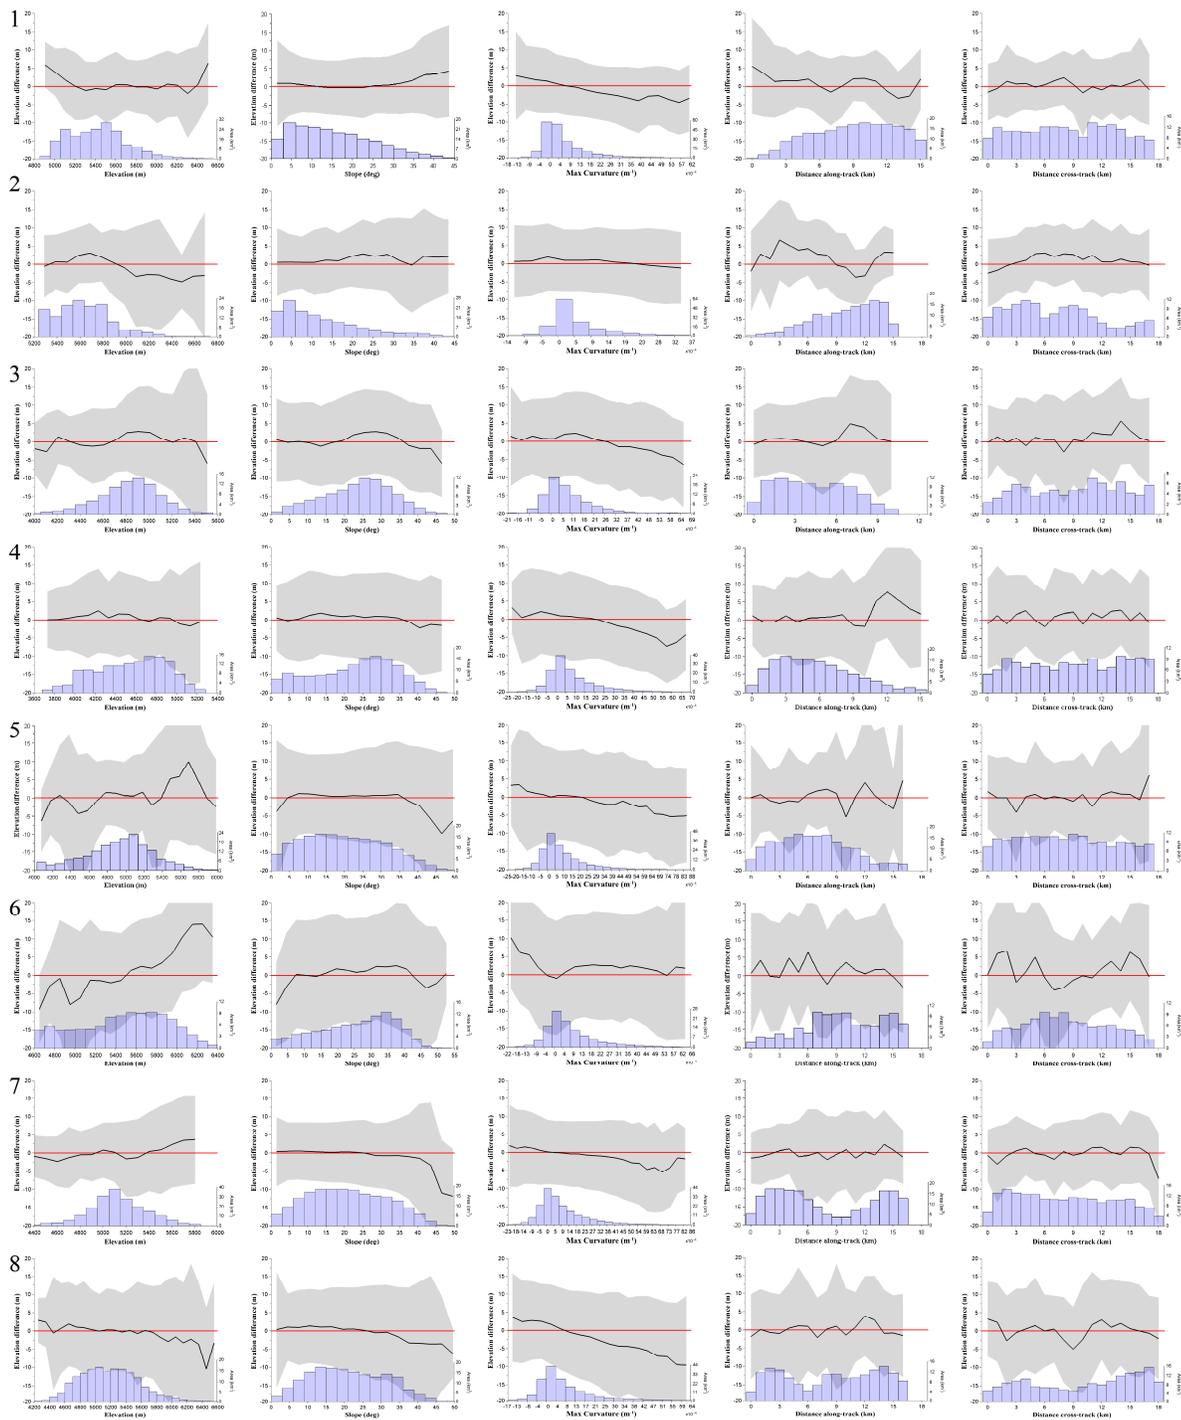

Figure S1. Plots of elevation change vs. elevation, slope, maximum curvature, and ASTER along-track and cross-track directions for assumed stable terrain in each of the 8 Hexagon DEM regions given in Table S1. Black curves and grey shaded regions indicate the mean and standard deviation of each bin, respectively. The area (km²) contained in each bin is indicated by the blue histogram bars, calculated as the number of pixels per bin * pixel resolution².
