

Dear authors

I am pleased with your revision. I agree with some general concerns raised by some of the reviewers that the contribution does not include new science, but I can truly see the value of reporting on this extreme even. Its description is state-of-the-art and I consider your contribution as suited for TC as short contribution.

Some minor technical comments:

Line 106 (and elsewhere): please consistently use elevation (instead of altitude).

Line 111: Suggest rewording. Difference?

Line 123: Please consistently add the multiplication sign: “×”, i.e. $4.0 \times 10^6 \text{ m}^3$

Lines 196-199: This sentence is a bit hard to follow. Suggest rewording. Maybe, ... between steep hanging glaciers and the massive collapses...

Line 204: What is the source slope? Suggest rewording.

Line 236: fine grained deposits?

11 March 2019/Jürg Schweizer.
