First, my apologies for this taking longer than it should have but I was travelling at a time that coincided with your re-submission. I want to provide a more thorough review of your manuscript, but I suspect that something went wrong when you updated Figure 3. The caption states: "The vertical bars mark dates when the feature-tracking metric indicated the presence (grey) or absence (pink) of a rigid mélange." However, I do not see that in the figure. I wonder if you could update the figure so that I can finish the review as I think my decision would hinge on these results. Thanks very much, Ginny
