Hi Dr. Heilig et al.,

Thanks again for your submission to The Cryosphere Discussions. I have examined the referees' comments and found them to be both constructive and uncommonly compatible. Both find value in the study of the compatibility of radar-mapped accumulation and snow pits, but they take issue with how the motivating questions are framed and the complexity of the language used to describe the results. I recommend that you hew closely to their comments in your response, and that your native English co-authors carefully review the manuscript to ensure your study is communicated as effectively as

C1

possible.

Thanks,

Joe MacGregor
