Lines 375 to 381 - In my humble opinion, these are the most important data to eventually discover: proportion of potential avalanche paths releasing the given avalanche problem for the forecasted spatial and temporal scale hazard rating.

These data will be very difficult, or impossible for size 1 avalanches, to acquire but are the most important for avalanche risk management practices, i.e. how many / much of the avalanche paths / terrain are expected to release the forecasted avalanche problem type today?

A very important paper and adds much to the field.
