

This paper uses CryoSat-2 radar altimetry (and OIB ice thickness data and MEaSURES velocity data) to determine glacier runoff in a northern Greenland glacier basin. The Humboldt is used as a test case for this method.

The author has directly and adequately addressed many of the points that I raised in my previous review. The changes based on these comments and those of the second reviewer have greatly improved the manuscript.

Here are a couple minor comments:

Eq 1 should probably be followed by a comma

Eq 2 has a stray '.' (between the 'A' and the rho\_w), which needs to move to the end of the equation.
