Received and published: 11 July 2020

We thank Dr. Renato R. Colucci (reviewer) for a detailed and constructive review of the manuscript “Subglacial carbonate deposits as a potential proxy for glacier’s existence”. We are happy that the importance of the topic has been noticed as well as the rising tendency of a different perspective of Alpine glaciation size during the Holocene. We have strengthened the discussion and deepened the analysis of the palaeoclimatic significance of the results. The draft will be checked for English after the second reviewer comments will be considered and the final draft is submitted. Responses to specific comments are attached as a supplement file.
