

Figure S1: Same as Figure 3 from the main text, except using the 18H channel for all derivations. Dome C (a) Brightness temperature from AMSR-2 (18H; black line) with thresholding techniques from Zwally and Fiegles (1994; cyan line), Torinesi et al. (2003; blue line), and Picard et al. (2022a; red line). (b) Correlation length converted from NIR SSA values in Brucker et al. (2011) assuming a 4 m penetration depth (black dotted line) and a 10 m penetration depth (black dashed line). Correlation length computed from the hybrid method (18H; green line) and the hybrid method BC version (navy line) along with grey bounds that represent $4\overline{\sigma_{p_{exp}}}$. (c) AMSR-2 brightness temperature (18H; black line). Hybrid method dry snow brightness temperature, BC version (18H; purple line) along with propagated $4\overline{\sigma_{p_{exp}}}$. (d) Same as (c) but for non-BC version. (e) The difference between the hybrid method's dry snow brightness temperature BC and non-BC versions (18H; purple line). (f) The difference between propagated $4\overline{\sigma_{p_{exp}}}$ between the BC and non-BC versions (grey line).

Figures S2 to S31 (See following pages): Data from AWS site listed in plot title. (a) Brightness temperature from 18H from AMSR-2 (black line) with thresholding techniques from Zwally and Fiegles (1994; cyan line), Torinesi et al. (2003; blue line), and Picard et al. (2022a; red line). (b) The exponential correlation length computed from the hybrid method (green line) along with $\pm 4\overline{\sigma_{p_{exp}}}$ bounds, with median filter (black line). (c) AMSR-2 brightness temperature (18H; black line). Hybrid method dry snow brightness temperature (channel as listed in plot title; purple line) with propagated $4\overline{\sigma_{p_{exp}}}$ (grey bounds). Melt days detected by hybrid method (blue dots).
